

Student Name: Rohan

Subject: Biology

Question 1: What is photosynthesis?

My Answer: Photosynthesis is the process utilized by green plants and other organisms to convert light energy into chemical energy. The chemical equation for photosynthesis is $6\text{CO}_2 + 6\text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$. It takes place in the chloroplasts.

Question 2: What is the primary function of the mitochondria in an animal cell?

My Answer: The mitochondrion is a double-membraned organelle found in most eukaryotic organisms. The primary function of the mitochondria is to generate most of the cell's supply of adenosine triphosphate (ATP), which is used as a source of chemical energy.
