

Student Name: Priya

Subject: Biology

Question 1: What is photosynthesis?

My Answer: The process of photosynthesis happens in a few main steps.

1. First, the plant absorbs water through its roots and carbon dioxide from the air through its leaves.
2. Next, the chlorophyll inside the plant's chloroplasts traps energy from sunlight.
3. Finally, the plant uses this solar energy to convert the water and carbon dioxide into glucose (sugar for energy) and oxygen, which it releases.

Question 2: What is the primary function of the mitochondria in an animal cell?

My Answer: The main function of the mitochondria is to perform cellular respiration to generate energy.

First, it takes in nutrients like glucose along with oxygen. Then, through a series of chemical reactions, it breaks down the glucose. The result of this breakdown is the production of ATP, which is the molecule that provides energy for all of the cell's activities.
